

# Rishika Jain

- Mechanical Engineer
- Interested in Design and Manufacturing
- Firm believer in leadership, teamwork and collaboration
- Loves travelling, cooking, amicable, admiring diverse cultures
- Being a Bluedevil

# Solar Engineer- Manabu Foundation

- Drafted solar panels using Autocad
- Added new material in its library to give the similar properties of PV material. (Gallium arsenide)
- Gave the background using Revit to increase the visual graphics.
- In Future need to made electrical connections to the substation and transformers as shown

## Known:

$p_t$  = Total Pressure

$T_t$  = Total Temperature

$p_o$  = Free Stream Pressure

$\gamma$  = Specific Heat Ratio

$R$  = Gas Constant

$A$  = Area

Mass Flow Rate:

$$\dot{m} = \frac{A^* p_t}{\sqrt{T_t}} \sqrt{\frac{\gamma}{R}} \left( \frac{\gamma+1}{2} \right)^{\frac{\gamma+1}{2(\gamma-1)}}$$

Exit Mach:

$$\frac{A_e}{A^*} = \left( \frac{\gamma+1}{2} \right)^{\frac{\gamma+1}{2(\gamma-1)}} \frac{\left( 1 + \frac{\gamma-1}{2} M_e^2 \right)^{\frac{\gamma+1}{2(\gamma-1)}}}{M_e}$$

Exit Temperature:

$$\frac{T_e}{T_t} = \left( 1 + \frac{\gamma-1}{2} M_e^2 \right)^{-1}$$

Exit Pressure:

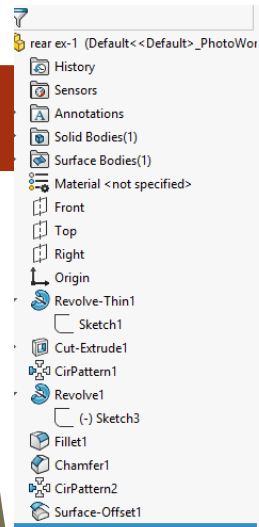

$$\frac{p_e}{p_t} = \left( 1 + \frac{\gamma-1}{2} M_e^2 \right)^{-\frac{\gamma}{\gamma-1}}$$

Exit Velocity:

$$V_e = M_e \sqrt{\gamma R T_e}$$

$$\text{Thrust: } F = \dot{m} V_e + (p_e - p_o) A_e$$

# Static structural analysis in ANSYS

- NODES: 3219378
- ELEMENTS: 2282197

Deformation

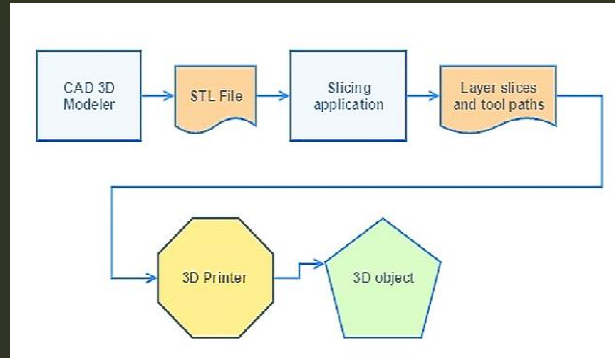

Strain Energy

Basic deformation analysis on the compressor blades

# Additive manufacturing(3D-Print)

- Selective Laser Melting (SLM)-cobalt chrome
- Vat Polymerization techniques
- Material
- Fused Material Deposition

AM	CNC	Molding
<ul style="list-style-type: none"> <li>• Polymers, Metals, Ceramics, Waxes, Paper laminates, Composites</li> <li>• Generally superior for complexity</li> <li>• Potentially large number of parameters, but relatively simply</li> <li>• Must consider orientation</li> <li>• Once parameters dialed in, rinse and repeat for new parts</li> <li>• Single stage*</li> <li>• Batch print</li> <li>• Predictable duration</li> </ul>	<ul style="list-style-type: none"> <li>• Hard, non-brittle materials only (metal, hard polymer, wood)</li> <li>• Very wasteful</li> <li>• Limited for undercuts, enclosed features</li> <li>• Determining sequence of tools/cuts can be very involved</li> <li>• Each part may require its own strategy</li> <li>• Multi-stage</li> <li>• Repositioning</li> <li>• Time can be unpredictable</li> </ul>	<ul style="list-style-type: none"> <li>• Polymers, Metals, Ceramics, Waxes</li> <li>• Wasteful molds</li> <li>• Very limited for internal or complex features, Must be able to assemble (and remove) mold</li> <li>• Mold/tool can take months to develop</li> <li>• Each part requires its own mold/tool</li> <li>• Mold/tool can take months to develop (\$\$)</li> <li>• Great for high volume</li> </ul>

# Design And Analysis of Automotive Powertrain Differential using Static Analysis

Two traditional materials with properties of new NYLON 66 and compare their performances:

- Structural steel
- Aluminium
- Reinforced polymer polyamide nylon 66

- Designed using solidworks - Complex part
- Many internal features designed easily
- Analysis has been done in ANSYS
- FEA setup used by the EATON design model all the pressure condition and forces are given to it.
- Normal stress and shear stress have been calculated
- The maximum shear stress in aluminum is 9.4506 MPa and in steel is 9.4108 while in nylon it is 7.932MPa which is much lesser as compared to both the material
- As the result of using NYLON weight is reduced and corrosion resistance is provided with less loss of power due to lower coefficient of friction

# **"Performance and Economic Design Evaluation of Twin Turbochargers in V6 Engine"; IEEE paper ID: PID4111405 -ICETECHGE271**

- V6 Engine is made using SOLIDWORKS
- Piston, connecting rods, Crankshaft camshaft and bearing caps, intake and exhaust manifold, Turbochargers, airfilter all being dimensioned
- Design compiled modelled assembly in Solidworks 4 stroke CI engine with 2 lts capacity and 12 valves
- Solidworks Flow simulation using turbulent wall boundary flow conditions with 6 bar static pressure and mass flow rate of 0.18 kg/s
- The analysis show the increase in horsepower and average speed when compared the engine simulation with or without being turbocharged

# Low budget GO – KART using Bike Engine

In just \$200

- Lead team of 4 people and did 3D Modelling of Go-kart chassis in SolidWorks and analysis of chassis using ANSYS for stress testing
- Manufactured a fully operating go kart using various welding techniques
- I majorly designed the ackerman principles and designed the steering and chassis.
- Rest all components were divided among team of four

# Works at MKU Ltd.

## Bullet penetration test

- Testing on helmets and nonlinear dynamics for crack propagation in ceramics

## Design of Mold and Die

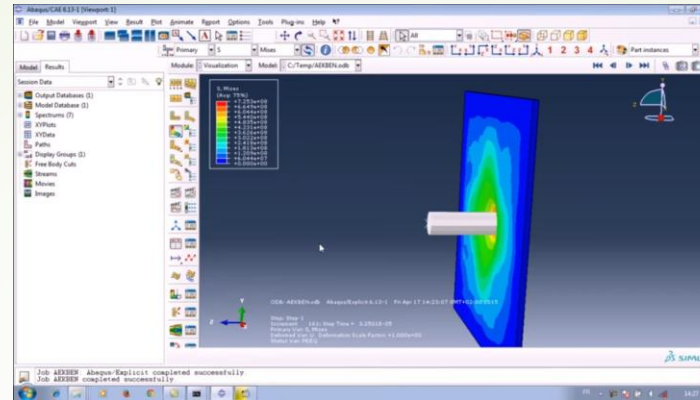

- Curvature compression die and mold were designed using Solidworks
- Provided better protection

## Press machining tool design

- Designed a tool machine to press the aramid material before molding

## Tensile Testing and autoclave molding

- Performed various physical tests to see the durability of the helmet

<b>Degradation of cutting tool and Anomaly detection, Data Analytics (Python)</b>	<b>10/2019 – 12/2019</b>
<ul style="list-style-type: none"> <li>• Performed feature extraction on the dataset, extracted time and date by changing the format to datetime.</li> <li>• Improved the model by 52% using SARIMAX model, reduced RMSE from 144 to 68.86.</li> </ul>	
<b>ERP Marketplace Simulation Game, Supply Chain (SAP-ERP, Data Visualization, Excel)</b>	<b>09/2018 – 12/2018</b>
